NBD & CRR Sales System — Application Flow & Module Reference

 Core module  Automatic (no button — happens on load)  Independent / standalone

Every module reports into one live Dashboard

Login authenticates via localStorage (AuthContext) → Dashboard pulls all 7 sheets in parallel and computes Total / Pending / In Progress / Completed / Delayed per module. Admin-only pages (User Management) are gated by role.

Cross-module data handoffs

Two kinds of connection: a **button-driven handoff** (someone clicks something, e.g. capturing a lead's outcome) vs an **automatic aggregation** (a page just pulls in matching rows from another sheet every time it loads — no button anywhere triggers it).

LEAD → ENQUIRY → OFFER

FEEDS INTO MARKETING VISIT

FEEDS INTO ORDER NOT RECEIVED FMS — all three, automatic

STANDALONE

CUSTOMER COMPLAINT

Manual entry only — no automatic links either way

One backend for every module

Every page (frontend: React/Vite) talks to a single Google Apps Script Web App URL. There is no traditional database — each module reads and writes its own named Google Sheet tab. File uploads (e.g. Offer Image) go to Google Drive and a link is stored back in the sheet.

ACTION	WHAT IT DOES
GET (read)	No action param — returns the full sheet's values by name. Every page's "Refresh" button re-runs this.
insert	Appends one new row to the end of a sheet (e.g. a new Lead, a new Complaint).
batchInsert	Writes multiple rows in a single call — used by CRR Enquiry's multi-product "Add Row" batch entry.
update	Merges non-empty fields into an existing row (a full-row rewrite that leaves blanks untouched).
updateCell	Sets exactly one cell by row + column index — used for precise status/stage changes.
delete	Hard-deletes a row from the sheet.
markDeleted	Soft-delete — flips a "Deleted" column to "Yes" instead of removing the row.
uploadFile	Sends a base64 file to Google Drive, returns a shareable link (e.g. Offer Image, complaint attachments).

NBD Lead — where every outgoing lead starts

Page: `Leads.jsx` Route: `/leads`

Handoff on outcome capture (button-driven): at "Update Status", if the recorded outcome is **Enquiry Received = Yes** and the target system is **NBD**, the app navigates straight into **NBD Enquiry** with the lead pre-filled. If the outcome is **Arrange Visit**, it instead opens **Marketing Visit** with the lead pre-filled.

NBD Enquiry — call-tracking pipeline

Page: CallTracker.jsx

Route: /call-tracker

Auto-feeds Offer (no button): once Order Received = Yes, or the stage reaches Make Offer / Re-Offer, a matching row is written into the Offer sheet automatically.

Auto-feeds Marketing Visit & Order Not Received FMS: any row with an active Current Stage/Status is picked up by Marketing Visit on load; any row marked "not received" is picked up by Order Not Received FMS on load.

CRR Enquiry — repeat/retention pipeline

Page: CRREnquiry.jsx

Route: /crr-enquiry

Supports creating **multiple products in one enquiry** (batch "Add Row"), each getting its own unique Enquiry No. This module's own "Send Offer" stage is internal to CRR Enquiry — it does **not** write into the separate Offer module.

Auto-feeds Order Not Received FMS: any row that ends up "Order Not Received" is picked up automatically — no button required.

Offer — quotation approval pipeline

Page: `Offer.jsx` Route: `/offer`

Rows arrive automatically from NBD Enquiry (see previous page) — this module has no standalone "New Offer" creation button.

Marketing Visit — plant visit tracking

Page: `MarketingVisitTracker.jsx`

Route: `/marketing-visit-tracker`

Populated from three sources on every load:

- 1) **Manual** — logged directly on this page ("Log Client Plant Visit Report")
- 2) **NBD Lead** — leads whose captured outcome was "Arrange Visit"
- 3) **NBD Enquiry** — any enquiry row with an active stage/status

Customer Complaint — resolution workflow

Page: `CustomerComplaint.jsx`

Route: `/customer-complaint`

Fully standalone — every complaint is registered directly on this page ("Register new Complaint"). Nothing feeds in or out automatically.

Order Not Received FMS — recovery pipeline

Page: OrderNotReceivedFMS.jsx

Route: /order-not-received-fms

This entire module is fed automatically — every time it loads, it merges in every unresolved "not received" row from three other modules: **NBD Lead**, **NBD Enquiry**, and **CRR Enquiry**. There is no manual "New" entry button.
